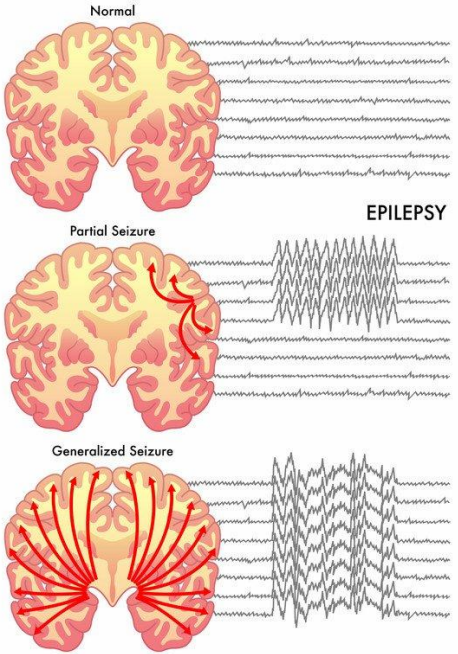
Introduction

What is **epilepsy**[1]?

- Epilepsy is a disease caused by the **synchronous**, **excessive** or **abnormal** activity of neuronal cells in the brain.
- Multiple causes.
- 50 million people/Brazil = 2% [2]



Normal Brain (on top) and Brain with epilepsy (below) [2]

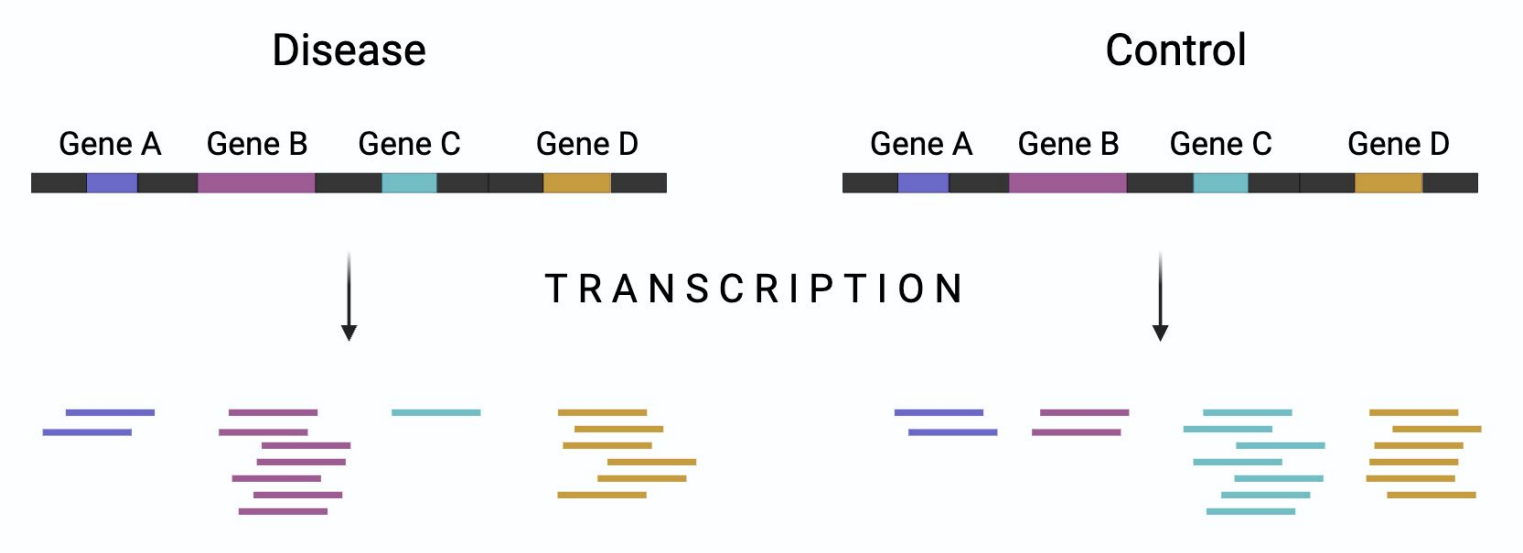
Transcriptomics

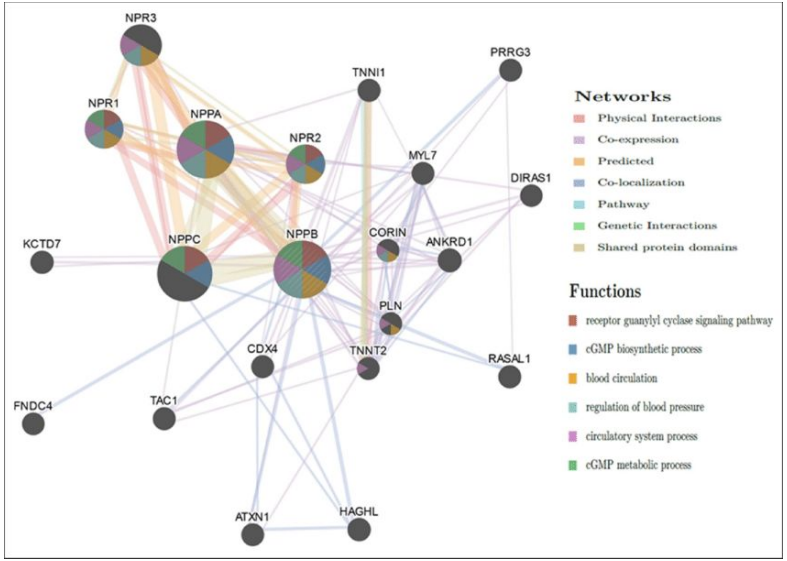
- Quantifies RNA expression by number of transcript counts



Genes B and C = Differentially Expressed Genes (DEGs)

Proposal

- Apply **network science methods** in the analysis of differentially expressed genes in patients diagnosed with **epilepsy** caused by Focal Cortical Dysplasia type 2b (FCD 2b)
- Analyze the correlation between **genes** and **biological functions**



Schematic illustration of the gene network and biological functions involving the NPPB gene[4]

Research Questions

- What are the differentially expressed genes between **disease** and **control group**?
- Which **biological functions** are most represented in the disease? → **functional networks**
- How are these genes being regulated? → **regulation networks**

Methodology

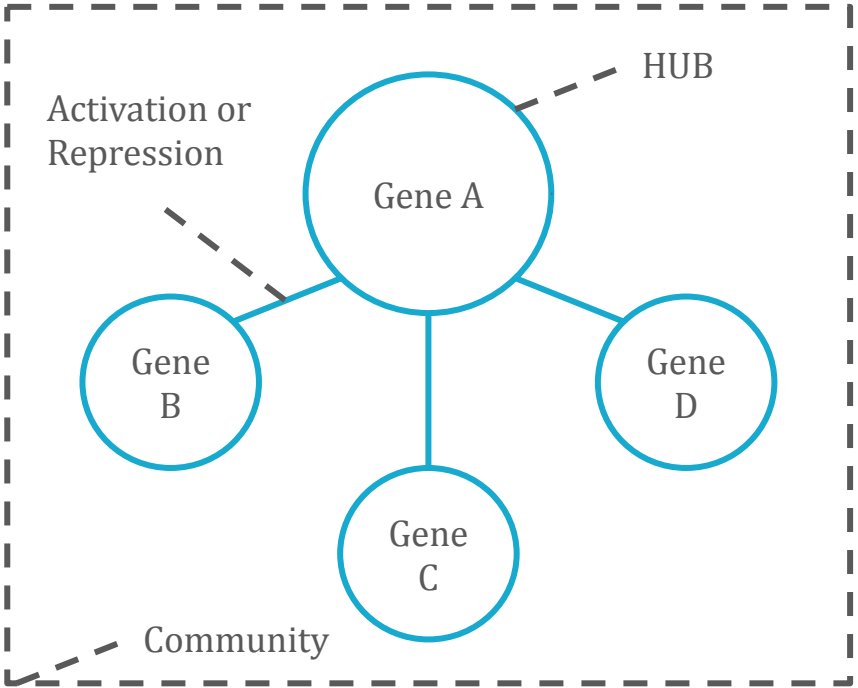
- Determine gene expression difference using **DESeq2**[5] package of *Bioconductor Software*
- Create a network of interactions with the identified **differentially expressed genes**
- Integrate the network with functional annotation information, using *Gene Ontology*[6], and relate them to their respective **biological functions** and **signaling pathways** that are involved, resulting in a functional enrichment analysis

Bioconductor
OPEN SOURCE SOFTWARE FOR BIOINFORMATICS

GENEONTOLOGY
Unifying Biology

Methodology

- Network Science techniques to explore the organization and dynamics of genes:
  - **Functional enrichment analysis**: identify biological functions or pathways enriched, revealing their main biological associations
  - **Centrality analysis**: identify genes that play important roles in the functioning of epilepsy
  - **Community detection**: reveal groups of genes that strongly interact with each other
  - **Perturbation and robustness analysis**: assess how the removal or perturbation of specific genes affects network structure and function



Softwares and Tools

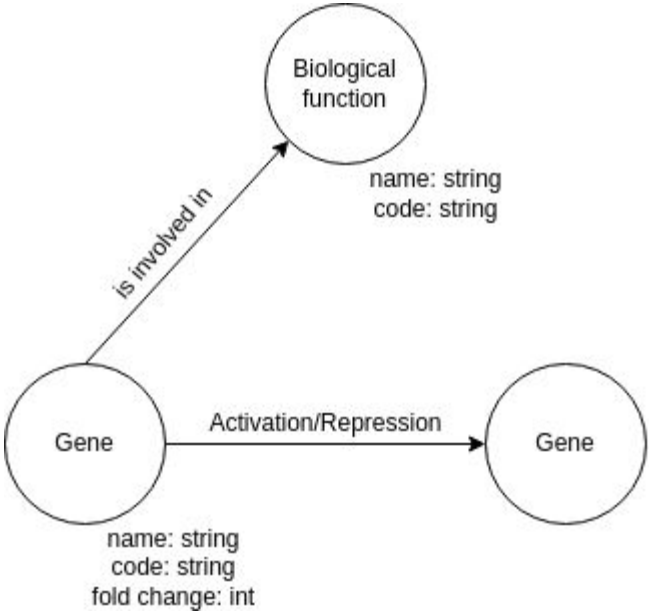
- **DESeq2**[5]: Differential expression tests

- **Cytoscape**[7]:
  - Generation of a network of differentially expressed genes with associated biological functions
  - Analysis using Network Science techniques

Data Base

- Transcriptomes distinguish human FCD subtypes (NCBI)[8]:
  - Format: CSV (data) and XLSX (metadata)
  - Size: 5.5 Mb (data) and 5 Mb (metadata)
  - Row represents genes and columns represent samples
- Gene Ontology[6]:
  - Formats: OBO and OWL
  - Computational representation of the current scientific knowledge about the functions of genes from many different organisms
    - Functions of genes: the protein and non-coding RNA molecules produced by genes

Logic Model



Biological function
